VoteApp - Campus Election Android App \(repo summary\)

What it is: Android app for campus elections using Firebase Auth and Realtime DB.
Who it’s for: Campus election admins, student voters, and candidate applicants.

What it does:
- Role-based login via Firebase Auth; student login can require fingerprint.
- Capture student IDs with camera and ML Kit; save locally for voting.
- Geofenced, time-bound sessions; fused location checks inside admin-set radius.
- Voting syncs to Firebase and Room, blocks duplicate student IDs, tags time/location.
- Candidate flow: applicants upload profile/docs; admins approve or reject and publish.
- Admin tools: broadcasts with optional SMS, clear cloud data, results charts and PDF export.

How it works:
- Shell: Splash -> Login/Register -> MainActivity with role-aware tabs.
- Tabs cover voting, ID scan, broadcasts, geofence, results, candidates.
- Cloud: Firebase Auth + Realtime DB for users, candidates, votes, geofence, broadcasts.
- Offline persistence enabled in VoteApp Application.
- Local cache: Room stores votes, candidates, users, broadcasts, geofence.
- SessionManager keeps role, name, department, year in SharedPreferences.
- Services: ML Kit text recognition and fused location for geofence checks.
- Services: BiometricPrompt for login/vote; MPAndroidChart and PdfDocument for results.

How to run:
